Let's Start!

What is RUP about?

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Talk about particular topics related to software programming.

Can Do Statements:

- I can explain what RUP is.
- I can talk about related concepts to RUP.
- I can understand important details related to RUP.

Ask your partner:

- What do you know about unified process?
- What stages do you think are necessary to include in the development of software? Why?

Let's Explore!

Peter is asking his friend Sue what RUP is all about.

Instructions: Read the text below.

Peter: Hi, Sue! I was looking for you. I need your help! You know I'm used to doing things on my own, but I don't know what to do.

Sue: Hi, Peter! Tell me, what is it?

Peter: I need to learn how to use RUP, and I don't even know what that is. I'm so going to fail this course!

Sue: You found the right person; I'm used to working with RUP.

Peter: Cool. So, let's start. What's RUP?

Sue: RUP, or Rational Unified Process, is an object-oriented and web-enabled methodology. It's like an online instructor that gives you templates, guidelines, and examples of program development.

Peter: Sounds interesting! I heard it is a comprehensive software engineering tool. But, what does it mean?

Sue: Well, it means that this tool not only combines the procedural aspects of development with other components but also includes them within a unifying network.

Peter: I see. I'm used to developing software in a different way.

Sue: Don't worry! RUP should show you the way through some phases of development.

Peter: Phases?

Sue: That's right. This process divides steps into certain separate iterations that must satisfy defined criteria before the next phase initiates. In the inception phase, you not only have the chance to define the scope of the project but also to define its business case. During the elaboration phase, my favorite, you analyze the project's needs in detail, and define the architectural foundation. Then, during the construction phase, you create the application design and source code. I'm very used to working on this phase, but I still have to learn much more about it. Finally, in the transition phase, you deliver the system to users.

Peter: Now, I have a better picture. Thanks a lot, Sue!

Sue: No problem!

Let's Practice!

Talking about what RUP is

Instructions: Read the sentences and underline all the sentences referring to something familiar.

I was looking for Sue because I needed her help. I'm used to doing things on my own, but I didn't know what to do. I'm not used to using RUP and I really needed some help. She told me that she was used to working with RUP, or Rational Unified Process. She said that this is an object-oriented and web-enabled methodology. Programmers are used to using it as an online instructor that gives them templates, guidelines, and examples of program development.

Let's Practice!

I don't understand RUP! I'm used to developing software in a different way.

Instructions: Select the correct answers.

1. Don't worry! RUP _____ show you the way through some phases of development.
 - a. have
 - b. shouldn't
 - c. has
 - d. should
2. These phases are divided into certain separate iterations that _____ satisfy defined criteria before the next phase initiates.
 - a. might
 - b. must
 - c. could
 - d. mustn't
3. During the elaboration phase, you _____ to analyze the project's needs while defining the architectural foundation.
 - a. has
 - b. must
 - c. should
 - d. have
4. Finally, in the transition phase, you _____ deliver the system to users.
 - a. has
 - b. must
 - c. shouldn't
 - d. have

Extension Activity

Rational Unified Process

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Make a brochure about the Rational Unified Process (RUP) that includes a clear definition of the concept.
- Describe the four phases for software development proposed by RUP.
- Explain why RUP is important.
- Show your brochure to the class.

Self-Assessment

- | | Yes | No |
|---|-----------------------|-----------------------|
| 1. I give a clear definition of RUP. | ☐ | ☐ |
| 2. I recognize important concepts related to RUP. | ☐ | ☐ |
| 3. I describe the RUP's phases. | ☐ | ☐ |
| 4. I explain the importance of RUP. | ☐ | ☐ |

Target Words

- architectural foundation** (noun): set of principal design decisions about the system
e.g. During the elaboration phase, my favorite, you analyze the project's needs in detail, and define the architectural foundation.
- business case** (noun): argument intended to convince a decision maker to agree with some kind of action
e.g. In the inception phase, you not only have the chance to define the scope of the project but also to define its business case.
- iteration** (noun): a method in which a continuation of approximations, each building on the one preceding, is used to achieve a desired degree of accuracy
e.g. This process divides steps into certain separate iterations that must satisfy defined criteria before the next phase initiates.
- inception** (noun): initial stage of a developmental procedure
e.g. In the inception phase, you not only have the chance to define the scope of the project but also to define its business case.
- guideline** (noun): guide or indication for any given course of action
e.g. It's like an online instructor that gives you templates, guidelines, and examples of program development.
- program development** (noun): coded instructions for the creation of an individual software program or an entire information system and all related software
e.g. It's like an online instructor that gives you templates, guidelines, and examples of program development.

Learning Points

Be used to + ing in Affirmative

Be used to is an expression to talk about something that is familiar to us or that is not unusual.

The structure for this expression is:

Subject + be used to + verb (ing form) + complement

Example:

*I'm **used to** following the different stages of program development.*

Notice that the verb after **be used to** goes in the **gerund form** (ing) and the **verb to be** is conjugated in accordance with the subject (am, is, are).

Examples

- *You know I'm used to doing things on my own, but I don't know what to do.*
- *I'm used to working with RUP.*
- *I'm used to developing software in a different way.*
- *I'm very used to working on this phase, but I still have to learn much more about it.*

Not only--- but (also)

The construction **not only...but (also)** is a conjunction used to present two related pieces of information.

When we want to present two pieces of information together, and one of them is surprising or somehow unexpected, we used the structure **not only...but (also)**.

The first piece of information always goes right after **not only** and the second (and unexpected) piece of information goes after **but (also)**:

Example:

*The developer **not only** creates the application design but also the source code.*

Notice that the main verb goes in the affirmative form and is not repeated in the second part of the sentence.

Examples

- *Well, it means that this tool not only combines the procedural aspects of development with other components but also includes them within a unifying network.*
- *In the inception phase, you not only have the chance to define the scope of the project but also to define its business case.*
