Let's Start!

Let's see what the most efficient programming language is!

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Explain why some programming languages have better reputation than others.

Ask your partner:

- What is your favorite programming language?
- Would you rather have versatility over speed and memory, or vice versa?

Can Do Statements:

- I can read about the most efficient programming languages.
- I can write a list of the most efficient programming languages.
- I can understand different features related to programming languages.

Let's Explore!

Jack is trying to figure out* what programming language is the most efficient one.

*To "figure out" is when you discover, or work something out.

Instructions: Read the text below.

Kate: Hey Jack! What are you doing?

Jack: Nothing much, I'm skimming this website about the most efficient programming languages because I want to study one of these next year, but it seems like I might not be able to make a choice right now.

Kate: Let me take a look. Alright, this website elaborates on several features for each one. If we make a short list based on the popularity of the programming languages, you will have a clearer idea about them.

Jack: Okay, let's do it. Ranking by popularity my short list might go something like this:

1. Java
2. C
3. C++
4. Python
5. Assembly

Kate: Good. So, according to the website, if you want to learn something that is cost-effective and easy to learn, your best option is Java.

Jack: But I previously studied Java, what would you recommend?

Kate: I like C++ better, I feel it is more efficient for me, because of its speed; so if you want to work with better memory usage and speed, C or C++ are the best options you have. Then again, if you haven't got enough time, you should learn something that appeals to you, like Python, for example, which is also easy to learn. Or if you are interested in a challenge, try Assembly, which may be hard to learn and work with, but you might like it, who knows? My advice would be for you to find out what kind of software you want to write. If you like what you are learning, then it will feel more pleasant and not like something you're forced to learn.

Jack: You're right, this helped me a lot. Thanks, Kate!

Let's Practice!

Trying to decide the best option for next year

Instructions: Read the paragraph. Underline all the mistakes in the paragraph.

1. So we make a short list based on the popularity of the programming languages, you will have a clearer idea about them.
2. If you want to learned something that is cost-effective and easy to learn, your best option is Java.
3. If you are interested in a challenge, trying Assembly, which may be hard to learn and work with, but you might like it, who knows?

Let's Practice!

Most efficient programming language to choose

Instructions: Match column A with column B.

COLUMN A

1. be able to make a choice right now.
2. something that appeals to you.
3. go something like this: Java, C, C++, python, Assembly.

COLUMN B

- a. I want to study one of these next year, but it seems like I might not
- b. You should learn
- c. Ranking by popularity my short list might

Extension Activity

Checking Languages Advantages and Disadvantages

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for further information about programming languages and its features.
- Write notes and design a chart in which you show the advantages and disadvantages of each language.
- Share with your partner and answer the questions.

Self-Assessment

Yes No

- I look for further information about programming languages and its features.
- I create a chart to show the advantages and disadvantages of each language.
- I talk about language programming advantages and disadvantages.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **elaborate** (verb): to give additional details about something.
e.g. Alright, this website elaborates on several features for each one.
- **skim** (verb): to read or study, in a superficial manner.
e.g. I'm skimming this website about the most efficient programming languages because I want to study one of these next year.
- **nothing much** (idiom): very little, or nothing.
e.g. -Kate: Hey Jack! What are you doing? - Jack: Nothing much.
- **several** (adjective): more than one.
e.g. Alright, this website elaborates on several features for each one.
- **previously** (adverb): at a moment in the past.
e.g. But I previously studied Java, what would you recommend?
- **challenge** (noun): something that needs great mental effort in order to be done successfully.
e.g. Or if you are interested in a challenge, try Assembly, which may be hard to learn and work with.

Learning Points

Conditional tenses review

You use conditionals in English to describe the result of something that can or could happen in the present or future tenses; and the result of situations that might have happened in the past. The zero and first conditionals are the ones used in the present and future tenses.

You use the **zero conditional** to talk about something that is always true in the present. The condition causes a result which is always true.

To write a sentence using the zero conditional you must use the Following structure:

If + simple present + comma + simple present

Example:

If you want to learn how to program this software, you **have** to study hard.

You use the **first conditional** to talk about a possible situation in the future, the condition happens in the present and it has a consequence in the future.

To use the first conditional remember to use the following structure:

If + simple present + comma + future simple

Example:

If you learn how to use Java, you **will** be able to work in lots of platforms.

Examples

- *If we make a short list based on the popularity of the programming languages, you will have a clearer idea about them.*
- *If you want to learn something that is cost-effective and easy to learn, your best option is Java.*

Learning Points

Modal verbs review

We use modal verbs to express possibility, ability, permission or obligation.

Modal verbs are used as an auxiliary verb that helps modifying the main verb on the sentence. They are used in different situations and with different purposes. Here are some of the modal verbs organized by their function:

Function	Modal verb	Example
Ability	Can	<i>I can use Java as a programming language</i>
Possibility	May, Might	<i>You might be able to program software with this programming language.</i> <i>You may find this easier to learn.</i>
Permission	Can	<i>Can I use this computer to start programming?</i>
Advice	Should	<i>You should learn something you like.</i>
Obligation	Have to	<i>You have to study hard!</i>

Examples

- *If you are interested in a challenge, try Assembly, which may be hard to learn and work with, but you might like it, who knows?*
- *You should learn something that appeals to you.*

Learning Points

Understanding the importance of choosing words carefully and correctly

When you write a text, it is important for you to know which words to use or which ones would be more appropriate for the kind of text you're writing.

If you choose inappropriate words or expressions, your reader might not understand you, or they may understand something different to what you want to say. You must make sure you use the correct words, choosing them carefully to express exactly what you mean.

In order to do it, you might want to make use of two common objects: **a dictionary** and **a Thesaurus**.

A dictionary will help you find the definition of the word you want to use, division into syllables, part of speech and some examples of how to use the word.

Example:

Paperback (*ˈpeɪ.pər.bæk*), noun: a book with a cover made of thick paper.
I want to get a paperback to read on the plane

A thesaurus is also useful because you can find words with similar meanings to the one you're trying to use; or if you cannot find the right word for what you mean, then a thesaurus will find it for you.

Example:

Architect, noun. Artist, builder, creator, designer, engineer, inventor, planner.
