Let's Start!

What is SQL about?

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Explain briefly how different programming languages work.

Can Do Statements:

- I can explain what SQL is.
- I can describe how SQL works.
- I can identify and understand key features and concepts related to SQL.

Ask your partner:

- What do you know about computer programming languages?
- What features do you consider are important in programming languages?

Let's Explore!

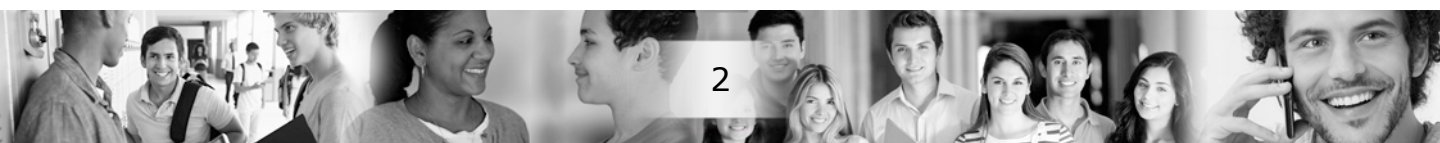

Let's hear an expert talking about SQL

Instructions: Read the text below.

SQL, which stands for Structured Query Language, is a special-purpose domain-specific programming language I'm used to working with because it's designed for organizing data in relational database management systems (RDBMS), also for stream processing in relational data stream management systems (RDSMS). This is to say that SQL is a data definition language for database language, which is a very useful tool in schema creation using a relational model.

I have to tell you, guys, cutting-edge technology works with this database language, this is why you have to ask yourself: as an engineer or programmer, am I used to managing information with relational models? Remember that these models allow programmers the use of specific SQL protocols for data insert, updating, and deleting such data. Remember that data security is one of the most important aspects for companies nowadays. This is why languages such as SQL became so popular since the 70's because you can use them in order to manage large amounts of information in a very intuitive and efficient way. As a very well trained programmer, are you used to working with SQL specific protocols and statements? If so, streaming information using scheme creation by means of a relational model, which is one of the most outstanding characteristics SQL provides the programmer with, is going to be just what you want to specialize in. Are you used to taking advantage of the whole potential of a programming language? When working with SQL there are also: query, schema creation and modification, and data access control, which I'm used to putting to the test in my current job. Now, things are not that easy with SQL. It's very important to bear in mind that learning the whole syntax of the language is hard work.

Let's Practice!

Frank is used to being confused after a technology lecture, luckily, Lucille is used to explaining all the concepts to him.

Instructions: Read the paragraph. Use the words from the Word Bank to correctly complete the paragraph. Read the text out loud and check your pronunciation with your instructor.

Word Bank

Query / special-purpose / organizing data / stream processing

SQL stands for Structured _____ Language. It is a _____ domain-specific programming language I'm used to working with because it's designed for _____ in relational database management systems (RDBMS), also for _____ in relational data stream management systems (RDSMS).

Let's Practice!

Frank is worried about his knowledge of SQL.

Instructions: Underline the correct answer. Practice reading the correct answers aloud with your partner. Compare your pronunciation.

1. As an engineer or programmer
_____ information with relational models?
a. are you used to create
b. am I used to managing
c. are you used to do
d. am I using managing
2. As a very well trained programmer,
_____ with SQL specific protocols and statements?
a. are we used to working
b. are they used to working
c. are you used to working
d. am I use to working
3. Are you _____ advantage of the whole potential of a programming language?
a. used to taking
b. used to take
c. using to taking
d. using to take
4. Am _____ SQL features to the test in my current job?
a. you used to putting
b. we used to putting
c. they used to putting
d. I used to putting

Extension Activity

Make a presentation about other characteristics SQL might have.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for further information about SQL.
- Prepare a presentation including the new information you consider relevant.
- Create the presentation using slides to show your findings.
- Share your findings with your class.

Self-Assessment

- I get new information on SQL.
- I design a presentation with relevant information.
- I create slides that show my findings.
- I share my findings with the class.

Yes No

☐ ☐
☐ ☐
☐ ☐
☐ ☐

Target Words

- stream processing** (noun): the speed rate at which information is streamed e.g. it's designed for organizing data in relational database management systems (RDBMS), also for stream processing in relational data stream management systems (RDSMS).
- statement** (noun): in technology: an input order or phrase e.g. Are you used to working with SQL specific protocols and statements?
- bear** (verb): to keep in mind, not to forget about something e.g. It's very important to bear in mind that learning the whole syntax of the language is hard work.
- data insert** (noun): a statement to add one or more records in a single table in a relational database e.g. Remember that these models allow programmers the use of specific SQL protocols for data insert.
- query** (noun): to ask or inquire about something e.g. When working with SQL there are also: query, schema creation and modification, and data access control.
- cutting edge** (noun): the leading position in any given field e.g. Cutting-edge technology works with this database language.

Learning Points

Be used to + ing in questions

You can use **be used to + ing** to talk about present habits. This means that you have certain routines in your life or habits you developed for some time now.

You can also use it to ask a person for those actions that have become a habit in their lives. Let's see how it works.

To talk about habits acquired in the present, you can use the following structure:

Subject + **verb to be + used to + verb + ing** + complement

Example:

***I'm used to working** with JavaScript instead of working with SQL.*

In order to make questions using this structure, you just have to place the **verb to be** at the beginning of the sentence, the way we do when asking questions with just **verb to be** (this, of course, when you are not asking a content or **Wh- question**, in that case, you need to place the **Wh-** before the **verb to be**).

This is the structure:

(Wh-) + **verb to be** + subject + **used to + verb + ing** + complement

Examples:

***Are you used to working** with SQL?*

*Why **are you used to working** with SQL instead of JavaScript?*

Examples

- *Are you used to taking advantage of the whole potential of a programming language?*
- *Are you used to working with SQL specific protocols and statements?*
- *Am I used to managing information with relational models?*

Learning Points

Common content words and expressions used in SQL

The following is a glossary of words used when working with SQL. Let's see what they mean.

Stream: The speed at which you download or upload, or transmit information from one storage device to another.

Processing: The ability and speed rate at which machines process information in a given language.

Data definition language: A language in which you introduce data in a program.

Schema creation: One of the functions of SQL with which the language can create a database scheme to manage information.

Database language: SQL is a database language. This means that programmers developed SQL specifically to create databases and organize and manage large amounts of information.

Relational model: It is a model that a certain language follows, such as SQL, in order to create a relational scheme through which manage database information.
