Let's Start!

Why should we use Java and Java script?

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Explain briefly how different programming languages work.

Can Do Statements:

- I can compare Java and Java script.
- I can explain why both, java and java script are different.
- I can give examples to show the differences of both programming languages.

Ask your partner:

- Do you use Java or JavaScript when programming? Why?
- What do you know about the most popular programming languages?

Let's Explore!

Professor Williams is talking about the difference between Java and JavaScript.

Instructions: Read the text below.

Good morning everyone! I am Professor George Williams and today's lecture is about Java and JavaScript. We know that they are both similar, but at the same time they are very different. Some people think that these two programming languages are simply the best; while some other people think that there are better programming languages.

Java is older than JavaScript; it was created in 1991 by James Gosling of Sun Microsystems as an object oriented programming language. JavaScript is a more dynamic and interpreted scripting language that was created in 1993 by Netscape. It was firstly known as LiveScript and alongside HTML and CSS, it is one of the most important elements of WWW content creation.

Even though both Java and JavaScript are OOP languages, they are quite distant in terms of their programming structures. For instance, JavaScript is comprised by a simpler and smaller set of instructions. Basically, we could say that JavaScript is the easiest programming language for the average software programmer.

What is the biggest difference between Java and JavaScript? The most important difference is that Java works on its own while JavaScript has to be located inside an HTML document. Java is therefore larger than JavaScript and it uses a more complicated language.

Both programming languages are also different in the way they show the language to the end user; while Java is arranged as "machine language", JavaScript is a "text-based language". A programmer uses Java to change text code into a formatted smaller language, making impossible to add or subtract anything without destroying the program. On the other hand, with JavaScript the programmer can alter the program multiple times since it is more independent.

There are many things we didn't say, but I guess this is the best way to start. Any questions so far?

Let's Practice!

A student explains the lesson to a classmate

Instructions: Proofread the sentences. Correct the mistakes.

1. Some people think there are bitter programming languages than Java and JavaScript.
2. You can either say that Java is more old than JavaScript or that JavaScript is newest than Java.
3. JavaScript works with most simple instructions than Java's.

Let's Practice!

A student reviews the information he got in class

Instructions: Match each word with a definition.

COLUMN A

1. If you need a dynamic language,
2. Java and JavaScript are two of
3. JavaScript is the easiest programming
4. JavaScript is one of the
5. Java works on its own while JavaScript has to be located inside an

COLUMN B

- a. the most interesting programming languages, nowadays.
- b. most important elements in WWW content creation.
- c. most popular programming languages.
- d. HTML document; it is the biggest difference between them.
- e. language for the average software programmer.
- f. JavaScript is the best option.

Extension Activity

The Differences and Similarities Between Java and JavaScript

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for more information about Java and JavaScript.
- Make a comparative chart in which you include similarities and differences between both of them.
- Share your comparative chart with your instructor.

Self-Assessment

Yes No

1. I find more information about programming languages.

☐ ☐

2. I write down differences and similarities between Java and JavaScript.

☐ ☐

3. I share my comparative chart with my instructor.

☐ ☐

Target Words

- **programmer** (noun): a person in charge of writing codes in order to program computers.
e.g. A programmer uses Java to change text code into a formatted smaller language.
- **therefore** (adverb): used to introduce a consequence or result from a previously described situation.
e.g. Java works on its own while JavaScript has to be located inside an HTML document. Java is therefore larger than JavaScript and it uses a more complicated language.
- **firstly** (adverb): at the beginning, before anything else, to begin with
e.g. It was firstly known as LiveScript and alongside HTML and CSS, it is one of the most important elements of WWW content creation.
- **while** (conjunction): that corresponds in a particular manner, at the same time.
e.g. Java works on its own while JavaScript has to be located inside an HTML document.
- **average** (adjective): typical, normal, regular.
e.g. JavaScript is the easiest programming language for the average software programmer.
- **on the other hand** (expression): in opposition to, in contrast to.
e.g. On the other hand, with JavaScript the programmer can alter the program multiple times since it is more independent.

Learning Points

The Use of Comparatives

We use **comparatives** when we want to contrast two nouns. In order to do that, we usually add the suffix **-er** to the adjective; but we can also use **more** and **both**.

We add the suffix **"er"** to most two-syllable adjectives in order to make a comparison between two nouns. However, it is really important to take into account some orthographic considerations:

Adjectives with one or two syllables.	Taller Smaller Faster
Adjectives with one or two syllables ending in e.	Nicer Larger
Adjectives ending with one or two syllables in y.	Prettier Easier
We double the last consonant with one or two syllable adjectives ending in a consonant-vowel-consonant combination.	Hotter Bigger
With adjectives that have more than two syllables, we use "more" .	More beautiful More interesting
Irregular adjectives that are irregular so they change completely.	Good - Better Bad - Worse Far - Further

Examples:

*This computer is **smaller** than the one I had last year, but it is also **faster**.*

*This program is **more** interesting and it is also **easier** to use.*

*Sometimes we use **"both"** to introduce two nouns in order to compare them:*

Example:

Both Java and JavaScript are good, but I guess that Java script is **better**.

Examples

- *Java is older than JavaScript; it was created in 1991 by James Gosling of Sun Microsystems as an object oriented programming.*
- *JavaScript is composed by a simpler and smaller set of instructions.*
- *Both programming languages are also different in the way they show the language to the end user.*

Learning Points

The Use of Superlatives

We use **superlatives** when we want to compare one noun with two or more nouns of the same kind. We use them to put a noun over the rest or over the general. In order to do that, we usually use **the** and we add the suffix **-est** to the adjective.

We add the suffix **-est** to most two-syllable adjectives in order to form a superlative structure. However, it is really important to take into account some spelling considerations:

Adjectives with one or two syllables.	The tallest The smallest The fastest
Adjectives with one or two syllables ending in e.	The nicest The largest
Adjectives with one or two syllables ending in y.	The prettiest The easiest
We double the last consonant with adjectives with one or two syllables ending in a consonant-vowel-consonant combination.	The hottest The biggest
With adjectives formed by more than two syllables we use "the most".	The most beautiful The most interesting
Irregular adjectives that change completely.	Good - The best Bad - The worst Far - The furthest

Examples:

*This computer is **the smallest** I've ever had, but surprisingly it is also **the fastest** of them all.*

*This program is **the most** interesting of the three and it is also **the easiest** to use.*

Examples

- *What is the **biggest** difference between Java and JavaScript?*
- *We could say that JavaScript is the **easiest** programming language for the average software programmer.*
