Let's Start!

The Most Popular Programming Languages Now

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Give information to describe the most popular programming languages.

Ask your partner:

- What programming language do you use the most? Why?
- What do you think the most popular programming language is?

Can Do Statements:

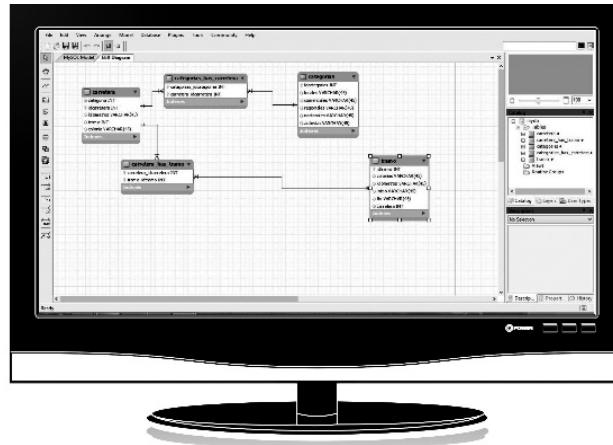

- I can read about the most popular programming languages.
- I can write a short text to talk briefly about the most popular programming languages.
- I can understand information related to programming languages in a written text.

Let's Explore!

The most popular programming languages that tech employers are looking for

Instructions: Read the text below.

Nowadays, many lucrative in-demand jobs require programming skills. Consequently, if you are thinking of becoming a developer, it is important to get to know the most popular programming languages.

SQL

SQL, which stands for Structured Query Language, is a programming language you use to design database technologies that power from small businesses to banks or universities. Actually, almost every person with access to technology uses SQL. Although it is a powerful language for doing simple to complex tasks, it does not require massive amounts of code.

Java

Java is a very popular programming language you use to produce software for multiple platforms. This is due to its compiled code which can run on most operating systems without compilation. Its syntax comes from the C and C++ programming languages. Its popularity with developers is undeniable because thousands of websites and applications will not work unless you install Java. Also, all original Android® apps used this language to develop their apps. Nevertheless, Java is not available on all platforms, and it will not run on older ones, so it will be a problem for institutions with no sufficient funds for software or hardware upgrades.

JavaScript

This is one of the most popular programming languages right now, but do not confuse with Java. You commonly use JavaScript to add visual effects to web pages or display pop-up messages. If you want to become a web developer, you should have a good knowledge of programming using JavaScript. This language is a great tool to generate a great user interface by making web pages highly interactive and responsive.

Although we don't intend for this list to be extensive, it gives an insight into the most popular programming languages that tech employers are looking for.

**Let's Practice!****Understanding the use of conjunctions**

Instructions: Select all the correct answers.

1. If he wants to create a user friendly software,
 - a. he needs to use JavaScript.
 - b. he uses C++.
 - c. he tries to use MySQL.
2. If you want to know what SQL stands for,
 - a. it means Structural Query Language.
 - b. it means Structured Query Language.
 - c. it means Structured Query Lenght.
3. If you want to use the same language used to develop all original Android® apps,
 - a. you use Java.
 - b. you use JavaScript.
 - c. you use SQL.
4. You don't use SQL for simple and complex tasks
 - a. unless you want a language that doesn't require massive amounts of code.
 - b. unless you want a language that uses several amounts of code.
 - c. unless you want a language that requires no code at all.

**Let's Practice!**

That's how programming languages help developers to apply different features in projects.

Instructions: Organize the mystery sentence. Read the sentences aloud. Check your pronunciation with your instructor.

1. important / programming / a / it / If / want / you / you / know / that / to / about / languages. / developer, / is / become
2. and / unless / websites / of / you / will / Java. / not / Thousands / install / work / applications
3. become / web / should / to / you / a / If / skills. / use / developer, / improve / to / JavaScript / visual / want / you

Extension Activity

Let's learn about the past

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about old programming languages.
- Write down ideas, and make a chart in which you explain their features and influence on the current languages.
- Share with your partner and answer questions.

Self-Assessment

Yes No

- I look for information about old programming languages.
- I design a chart to explain programming language features and influence.
- I talk about old programming languages.

☐	☐
☐	☐
☐	☐

Target Words

- **lucrative** (adjective): profitable, producing a lot of money.
e.g. Nowadays, many lucrative in-demand jobs require programming skills.
- **power** (verb): to provide something with what it needs to operate or work.
e.g. SQL, which stands for Structured Query Language, is a programming language you use to design database technologies that power from small businesses to banks or universities.
- **undeniable** (adjective): not questionable
e.g. Its popularity with developers is undeniable because thousands of websites and applications will not work unless you install Java.
- **sufficient** (adjective): enough
e.g. Nevertheless, Java is not available on all platforms, and it will not run on older ones, so it will be a problem for institutions with no sufficient funds for software or hardware upgrades.
- **responsive** (adjective): adjustable to the browser or device in which the web page is displayed.
e.g. This language is a great tool to generate a great user interface by making web pages highly interactive and responsive.

Learning Points

Conjunctions, although, but, nevertheless, consequently

A **conjunction** is an essential part of speech that we use to connect two sentences, clauses, phrases or words.

Let's take a look at some common conjunctions:

- **Although:**

You use **although** to contrast ideas; it means despite the fact that. It is used at the beginning of a subordinate clause.

Example:

Although Swift is not as compatible as Java, it is becoming increasingly popular among new software developers.

- **But:**

We use **but** to express contrast or a difference between two ideas.

Example:

SQL is used to handle huge amounts of information, **but** it doesn't need much coding.

- **Nevertheless:**

This conjunction has a similar meaning to however . It introduces a contrasting idea to something that is mentioned before.

Example:

Managing an SQL database doesn't require lots of code. **Nevertheless**, interfacing an SQL database is much more complex.

- **Consequently:**

It is used to show a cause-consequence relationship between two ideas. It is a synonym of **therefore** or **as a result**.

Example:

JavaScript is used to enhance how interactive a web page is. **Consequently**, it is a commonplace in user-friendly websites.

Learning Points

Examples

- *Consequently, if you are thinking of becoming a developer, it is important to get to know the most popular programming languages.*
- *Although it is a powerful language for doing simple to complex tasks, it does not require massive amounts of code.*
- *Nevertheless, Java is not available on all platforms, and it will not run on older ones, so it will be a problem for institutions with no sufficient funds for software or hardware upgrades.*
- *This is one of the most popular programming languages right now, but do not confuse with Java.*

Unless and if sentences

If and **unless** are conjunctions that you use to introduce conditional sentences.

You can use **if** to introduce situations or conditions and their results. Take a look at the following examples:

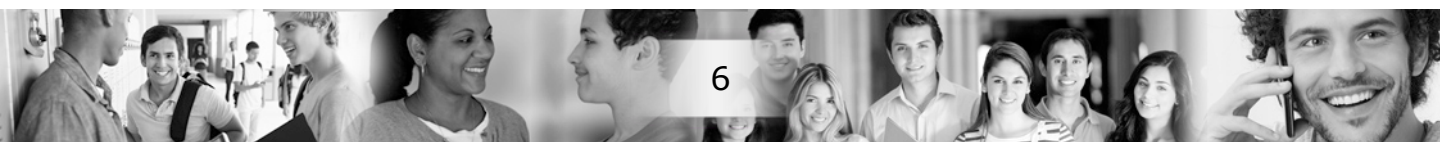

- ***If** a company needs to deal with huge amounts of information, it is necessary to hire a developer with experience and knowledge of SQL.*
- *The web site needs JavaScript **if** you want it to be user-friendly.*

The conjunction **unless** means **if not or except if**. The structure you use with **unless** is similar to the structure with **if**. The examples below are the same sentences rewritten with **unless** instead of **if**:

- ***Unless** a company needs to deal with huge amounts of information, it is **not** necessary to hire a developer with experience and knowledge of SQL.*
- *The web site **doesn't** need JavaScript **unless** you want it to be user-friendly.*

Examples

- *Consequently, if you are thinking of becoming a developer, it is important to get to know the most popular programming languages.*
- *If you want to become a web developer, you should have a good knowledge of programming using JavaScript.*
- *Its popularity with developers is undeniable because thousands of websites and applications will not work unless you install Java.*

Learning Points

Functional language review, basic sentence patterns

If you are learning a foreign language, in this case English, it is common to have problems when it comes to writing formal or academic papers. Let's take a look at a very useful tip for making simple sentences in English.

Every sentence in English needs at least a subject and a verb in order to express a complete idea. In some languages, such as Spanish or Italian, this is not always necessary as the subject can be omitted because it is implicit.

Basic Statement Patterns

Subject + Verb + Complement

Example:

Subject	Verb	Complement
<i>Java</i>	<i>runs</i>	<i>on most platforms.</i>

Subject + Verb + Object + Complement

Example:

Subject	Verb	Object	Complement
<i>A web developer</i>	<i>uses</i>	<i>JavaScript</i>	<i>to enhance a web page interactivity.</i>
